Emergency Escape and Self Rescue Ropes and System Components for Firefighters

Part 800.7 of Title 12 of the Official Compilation of Codes, Rules, and Regulations of the State of New York (Cited as NYCRR 800.7)

Effective December 2, 2009
Emergency Escape and Self Rescue Ropes and System Components for Firefighters

(a) Title and citation. Within and for the purposes of the Department of Labor, this part may be known as Code Rule 800.7, Emergency Escape and Self Rescue Ropes and System Components for Firefighters, specifying the requirements for safety ropes and associated system components.

(b) Purpose and intent. This rule is intended to ensure that firefighters are provided with necessary escape rope and system components for self rescue and emergency escape and to establish specifications for such ropes and system components.

(c) Application. This part shall apply throughout the State of New York to the State, any political subdivision of the State, Public Authorities, Public Benefit Corporations or any other governmental agency or instrumentality thereof employing firefighters within the meaning of §27-a of the Labor Law. This Part shall not apply to such employers located in a city with a population of over one million.

(d) Definitions. Within this part, the following terms shall have the meanings indicated:

2. "Escape Rope" means a single purpose, single use, emergency escape (Self-rescue) rope.

3. "Interior Structural Fire Fighting" means the physical activity of fire suppression, rescue or both, inside of buildings or enclosed structures which are involved in a fire situation beyond the incipient stage.

4. "Interior Structural Fire Fighter" means a firefighter who is designated by their employer to perform interior structural firefighting duties in an immediately dangerous to life and health (IDLH) atmosphere and is medically qualified to use self-contained breathing apparatus (SCBA) as defined in 29 CFR 1910.134.

5. "Entrapment at Elevations" means a situation where a firefighter finds the normal route of exit is made unusable by fire, or other emergency situation, that requires the firefighter to immediately exit the structure from an opening not designed as an exit, that is above the ground floor and at an elevation above the surrounding terrain which would reasonably be expected to cause injury should the firefighter be required to exit.

(e) Specifications for escape ropes and system components. Escape ropes and system components provided to firefighters shall conform to the requirements of “The National Fire Protection Association Standard 1983, Standard on Fire Service Life Safety Rope and Equipment for Emergency Services” in effect at the time of their manufacture. Escape ropes and system components purchased after the effective date of this Part shall conform to the 2006 edition (NFPA 1983-2006) of such standard.

(f) Risk assessment and equipment selection.

1. Each employer who employs firefighters shall develop a written risk assessment to be used to determine under what circumstances escape ropes and system components will be required and what type will be required to protect the safety of firefighters in its employ. In performing the assessment, the employer shall:

   (i) Identify the types and heights of buildings and other structures in the area the firefighters are expected to work. Such area shall include the regular scope of the fire district or other area covered by the fire department in...
question as well as any other districts or communities to which the fire
department provides mutual aid with a reasonably predictable frequency.

(ii) Assess the standard operating procedures followed by the department with
regard to rescue of firefighters from elevations.

(iii) Identify the risks to firefighters of being trapped at an elevation during
structural fire fighting operations given the types of buildings or other
structures located in the area(s) in which firefighters are expected to work.
Identification of the risk in question shall include an assessment of:
(a) the extent to which standard operating procedures already in
place will mitigate the risks identified;
(b) the type of escape ropes and system components that will be
necessary to protect the safety of firefighters if operating
procedures do not sufficiently mitigate the risk.

(2) Should the risk assessment establish that firefighters employed by the department
performing interior structural firefighting are reasonably expected to be exposed to
the risk of entrapment at elevations, the employer shall provide to each interior
structural firefighter in its employ a properly fitted escape rope and those system
components which meet the specifications for such rope and system components
set forth in Section 800.7(e) and which would mitigate the danger to life and health
associated with such risk.

(g) Training.

(1) The employer shall ensure that each firefighter who is provided with an escape
rope and system components is instructed in their proper use by a competent
instructor. Instruction shall include the requirements of paragraph (h) of this Part
and the user information provided by the manufacturer as required by NFPA 1983
Chapter 5.2 for each rope and system component.

(2) Instruction shall include hands-on use of the equipment in a controlled
environment.

(3) A record of such instruction including the name of the individual being trained, the
name of the individual delivering the training, and the date on which the training
was provided shall be maintained by the employer until such time as the firefighter
is no longer employed by the employer or the employer delivers a subsequent
training on this topic, whichever comes first.

(h) Employer duties. In addition to the duties set forth in Parts 800.7(t) and (g), employers
covered by this Part shall have the following duties:

(1) To ensure the adequacy of the safety ropes and system components, the
employer shall routinely inspect and ensure that:
(i) Existing safety ropes and system components meet the codes, standards,
and recommended practices adopted by the Commissioner;
(ii) Existing safety ropes and system components still perform their function by
taking precautions to identify any of their limitations through reasonable
means, including, but not limited to:
   (a) Checking the labels or stamps on the equipment; and
   (b) Checking any documentation or equipment specifications; and
   (c) contacting the supplier or approval agency.
(iii) Firefighters are informed of the limitations of any safety rope or system
components;
(iv) Firefighters are not allowed or required to use any safety rope or system
components beyond their limitations;
(v) Existing or new safety ropes and system components have no visible
defects that limit their safe use;
(vi) Safety ropes and system components are used, cleaned and maintained according to the manufacturer’s instructions;

(vii) Firefighters are instructed in identifying to the employer any defects the firefighter may find in safety ropes and system components; and

(viii) Any identified defects are corrected or immediate action is taken to eliminate the use of the equipment by:

(a) Ensuring that escape rope and system components with defects which are repairable are tagged as unsafe and stored in such a manner that they cannot be used until repairs are made;

(b) Ensuring that escape rope and system components that cannot be repaired are immediately destroyed or rendered unusable as an escape rope and system components; and

(c) Ensuring that any escape rope that has been utilized under load for the purpose of self rescue or emergency escape is immediately removed from service, destroyed, or rendered unusable as an escape rope and immediately replaced.

(2) The employer’s routine inspection cycle required by this paragraph shall be based upon the volume of activity the Department undertakes but, in no case, any less frequently than once each month.
